Soil health, along with water supply, is the most valuable resource for humans, as human life depends on the soil's generosity. Soil degradation, therefore, poses a threat to food security, as it reduces yield, forces farmers to use more inputs, and may eventually lead to soil abandonment. Unfortunately, the importance of preserving soil health appears to be overlooked by policy makers. **Are Climate Models Overstating Warming? | Climate Etc.** by Ross McKittrick A number of authors, including the IPCC, have argued that climate models have systematically overstated the rate of global warming in recent decades. A recent paper by Millar et al. (2017) presented the same finding in a diagram of temperature change versus cumulative carbon emissions since 1870. The horizontal axis is correlated... **Human Health | National Climate Assessment** Climate change threatens human health and well-being in many ways, including impacts from increased extreme weather events, wildfire, decreased air quality, and illnesses transmitted by food, water, and diseases carriers such as mosquitoes and ticks. **Case Studies - ELD Initiative** Please find a list of our global and regional case studies below. The layman can't evaluate projections of temperatures for the year 2100. They can evaluate projections such as "snow is a thing of the past" and use of hurricanes and polar bears as symbols, both of which failed to do what was requested of them by the projections.*
